1. Overview

1.1 Advantages of COOLMAY MX3G PLC:

- ◆ The programming software is compatible with GX Developer 8.86/GX Works2 (supports ladder diagram and SFC language, does not support structured programming, does not support the use of labels).
- ◆ Super function. Compatible with FX3S series PLC, fast running speed.
- ◆ Adopts military-grade 32-bit CPU, which is fast and is more suitable for industrial environments with high electromagnetic interference.
- ◆ Special encryption function prevents illegal reading. 8-bit encryption, the login keyword is set to 12345678, which can completely close the function of reading the ladder diagram program, thereby protecting the user's program.
- ◆ Comes with 2 PLC programming ports. MX3G PLC comes with 1 MiniB USB port for faster download speed; 1 RS232 programming port, the interface terminal is an 8-hole mouse head female socket.
- ◆ Optional communication port, support Mitsubishi programming port protocol/MODBUS protocol/RS protocol, easily realize PLC interconnection and communication with external equipment such as HMI and inverter. MX3G PLC defaults to 2 RS485 or change to 1 RS232, 1 RS485 communication interface.
- ◆ High-speed pulse output is generally 4 channels, Y0~Y1 each 100KHz, Y2~Y3 each 50KHz;
- ◆ High-speed counting is generally 2 single-phase 60KHz + 4 10KHz or 1 AB (Z) phase 30KHz + 1 AB (Z) phase 5KHz;
- ◆ MX3G-32M comes with 2 voltage inputs, and the analog input accuracy is 12 bits.
- ◆ MX3G PLC digital is up to 16DI16DO; digital output type can choose transistor or relay and transistor mixed output.

- ◆ Convenient wiring, using pluggable terminals. MX3G PLC wiring terminals all adopt 5.00mm pitch pluggable terminals;
- ◆ Convenient installation. It can be installed on DIN rail (35mm wide) and fixing holes.
- ◆ Flexible use, more specifications and batches can be customized according to customer requirements.

1.2 MX3G PLC specification

Model	MX3G-16M	MX3G-32M
Image		
Dimension	65*90*66mm	130*90*66mm
Cutout size	57*99mm	122*99mm
Installation method	Fixed hole installation and 35MM standard rail installation	
Digital points	8DI 8DO (4 MR)	16DI 16DO (12 MR)
Input and output level	Y0-Y3: Transistor output, and DC24V active NPN output; Other output MT: low level NPN, COM connected to negative; Output MR: normally open dry contact; Input: Passive NPN, common terminal isolation	
Do type and load	Relay MR/transistor MT/mixed output MRT Y0-Y3: MT, output load 0.1A/point; Other transistors MT output load 0.5A/point, 0.8A/4 points COM, 1.6A/8 points COM; Other relay output loads are 2A/point, 4A/4 points COM, 5A/8 points COM, 5A/12 points COM.	
High-speed counting input	Conventional 2 single-phase 60KHz+4 10KHz or 1 AB(Z) phase 30KHz +1 AB(Z) phase 5KHz	
High-speed pulse output	Conventional Y0-Y1 is 100KHz, Y2-Y3 is 50KHz; High-speed counting + total high-speed pulse transmission cannot exceed 300KHz	
Analog points	/	Comes with 2 voltage 0-10V inputs
COM port	Comes with two PLC programming ports (1 MiniB USB port, faster download speed; 1 RS232 programming port, the interface terminal is an 8-hole mouse head female socket)	
	Total COM ports: 2. Default: 2 RS485; [Note: The purchase of 200 units or more can be customized as: 1 RS485, 1 RS232]	
Programming software	Compatible with GX Works2/GX Developer8.86Q	
Suggested model:	MX3G-16MT/MRT(-485/232) MX3G-32MT/MRT(-485/232)

4.2 Applied instructions 【Sequence is according to instruct variety】

(Contrast with MITSUBISHI FX3G PLC)

Applied instruction can be divided into the following 18 kinds.

1	Data move instructions
2	Data conversion instructions
3	Comparison instructions
4	Arithmetic operation instructions
5	Logical operation instructions
6	Special function instructions
7	Rotate instructions
8	Data operation instructions
9	Data operation instructions
10	Character string operation instructions
11	Program flow control instructions
12	I/O refresh instructions
13	Real time clock control instructions
14	Pulse output/positioning control instructions
15	Serial communication
16	Special block/unit control instructions
17	Other handy instruct

1. Data move instructions

Mnemonic	FNC No.	Function	Support
MOV	12	Move	★
SMOV	13	Shift Move	★
CML	14	Compliment	★
BMOV	15	Block Move	★
FMOV	16	Fill Move	★
PRUN	81	Parallel Run (Octal Mode)	★
EMOV	112	Floating Point Move	★

2. Data conversion instructions

Mnemonic	FNC No.	Function	Support
BCD	18	Conversion to Binary Coded Decimal	★
BIN	19	Conversion to Binary	★
GRY	170	Decimal to Gray Code Conversion	★
GBIN	171	Gray Code to Decimal Conversion	★
FLT	49	Conversion to Floating Point	★
INT	129	Floating Point to Integer Conversion	★

3. Comparison instructions

Mnemonic	FNC No.	Function	Support
LD=	224	Contact compare LD (S1)=(S2)	★
LD>	225	Contact compare LD (S1)>(S2)	★
LD<	226	Contact compare LD (S1)<(S2)	★

5. Application of analog

This section refers to the software version query, the version number is stored in the special register D8001, if necessary, please query the value of D8001.

5.1 Analog input

Input precision of coolmay MX3G PLC is 12-bit, directly read the corresponded register value of each analog while using.

5.1.1 Analog input (temperature)

Input signal	Range	Register value	Resolution	Accuracy (Total Measuring range)	Remark
Voltage	0-10V/0-5V	0~4000	2.5mV/1.25mV	1%	

5.1.2 Analog input reading

Support FROM instruction or register directly read. Such as: FROM K0 K0 D400 K16, read out 2 analog input, 0-10V.

The analog input of current, voltage, PT type and thermocouple type can directly read the register: D[8030]~D[8031]. The constant scan time is changed to D8059, which is started by M8039;

No.	Register reading value
AD0	D8030
AD1	D8031

5.1.3 Analog input sampling

Filtering cycles=(D8054、D8055)* PLC scanning time, if D8054=1, sample one time each scan circle and change the 1st analog value for one time. The larger D8054、D8055 value is, the result is more stable.

D8054、D8055 is filtering cycles, default is 10 (Range 2~20000);

D8100 is the smoothing filter coefficient of all analog inputs, default: 900;

setting range: 0~999.

5.1.4 Analog input program example:

Below is an example of MX3G's analog AD0 collection, the program read value is as follows:

Note: When the input is 0-10V analog, the actual analog value = register reading/400;

5.2 PID Instruction

1. Outline

This command is used to perform PID control that changes the output value according to the amount of change in the input.

2. PID instruction format and parameter description

Instruction format:

Parameter Description:

Operand Type	Content	Data Type	Word software component
S1.	Save data register number of the target value (SV)	BIN16 bit	D,R
S2.	Save data register number of the measured value (PV)	BIN16 bit	D,R
S3.	Save the data register number of the parameter	BIN16 bit	D,R
D.	Save data register number of the output register (MV)	BIN16 bit	D,R

3. Function and action description

16-bit operation (PID): After setting the target value S1., the measured value S2., and the parameters S3~S3+6 in the execution program, the operation result (MV) is saved to the output value D. every sampling time S3.

Setting item

Setting item		Setting content	Remark
S3.	Sampling time(Ts)	1~32767(ms)	Value shorter than the calculation period can't be run
S3.+1	ACT	bit0	0: positive action; 1: reverse action. Action direction (ACT)
		bit1	0: No input change alarm; 1: Input change amount alarm is valid.
		bit2	0: No output change alarm; 1: Output change amount alarm is valid. Do not turn ON bit2 and bit5 at the same time
		bit3	Can't use
		bit4	0: Auto-tuning doesn't work; 1: Perform auto-tuning.
		bit5	0: No output value upper and lower limit setting; 1: The output value upper and lower limits are valid. Do not turn ON bit2 and bit5 at the same time
		bit6	0: Step response method. Auto-tuning mode
		bit7~bit15	Can't use
S3.+2	Input filter constant (α)	0~99(%)	0 means no input filtering
S3.+3	Proportional gain ()	1~32767(%)	
S3.+4	Integration time()	0~32767(*100ms)	0 means as ∞ processing (no points)
S3.+5	Differential gain ()	0~100(%)	0 means no derivative gain
S3.+6	Derivative time ()	0~32767(*10ms)	0 means no differential processing
S3.+7 ... S3.+19	PID operation internal processing occupied, please do not change the data.		
S3.+20 *1	Input change amount (increase side) alarm set value	0~32767	(ACT): Valid when S3.+1 bit1=1
S3.+21 *1	Input change amount (decrease side) alarm set value	0~32767	(ACT): Valid when S3.+1 bit1=1
S3.+22 *1	Output change amount (increase side) alarm set value	0~32767	(ACT): Valid when S3.+1 bit2=1, bit5=0
	Output upper limit set value	-32768~32767	(ACT): Valid when S3.+1 bit2=0, bit5=1
S3.+23 *1	Output change amount (decrease side) alarm set value	0~32767	(ACT): Valid when S3.+1 bit2=1, bit5=0

	Output lower limit set value		-32768~32767	(ACT): Valid when S3.+1 bit2=0, bit5=1
S3.+24 *1	Alarm output	bit0	0: The input change amount (increase side) does not overflow; 1: Input change amount (increase side) overflow.	(ACT): Valid when S3.+1 bit1=1 or bit2=1
		bit1	0: The input change amount (reduction side) does not overflow; 1: Input change amount (reduction side) overflow.	
		bit2	0: The output change amount (increase side) does not overflow; 1: Output change amount (increase side) overflow.	
		bit3	0: The output change amount (reduction side) does not overflow; 1: Output change amount (reduction side) overflow.	

*1: When S3+1 action setting (ACT) bit1=1, bit2=1 or bit5=1, S3+20~24 is occupied.

4. Notice

When using multiple instructions: It can be executed multiple times at the same time (the number of loops is not limited), but note that the S3 and D devices used in the operation cannot be repeated.

Occupied points of parameter S3.: Step response method

1) ACT setting: when bit1,bit2,bit5 are all not "0",occupy 25points Soft Component starting from the Initial Soft Component specified in S3.

2) ACT setting: when bit1,bit2,bit5 are all "0",occupy 20points Soft Component starting from the Initial Soft Component specified in S3.

Step response mode: The self-tuning mode in the PID instruction has only a step response mode, and the step value is S0+22, which is the upper limit value.

When specifying the soft component in the power failure holding area:

If D. is specified in the program to hold the data register in the power failure,

needs to clear the specified register at the time of program start-up.

Action flag: Bit 0=0 of S3+1 is a positive action, and bit0=1 is a reverse action;

When heating, is reverse action.

7. Application of high speed pulse output

7.1 high speed pulse output

Coolmay MX3G PLC default has 4 channels high speed pulse, Y0~Y1 each 100KHz, Y2~Y3 each 50KHz, variable speed supported, the initial/final speed of start/stop is 0, diagram as below: (take accelerate and decelerate time D8348 as an example).

Acceleration and deceleration time T calculation = (target speed --- current speed) *
acceleration and deceleration time / maximum speed

For example: target speed = 50000, current speed = 20000, acceleration time 100 (ms),
maximum speed = 100000, T = 30 ms.

The following registers are supported when using PLSV, DRVI, DRVA, DVIT (interrupt positioning), ZRN, DSZR (origin return with DOG search) instructions:

Pulse point Function Description	Y0	Y1	Y2	Y3
Pulse operation monitoring	M8340	M8350	M8360	M8370

7.2 Pulse width modulation (PWM)

1. Outline

This instruction is used to specify the pulse period and pulse output of the ON time.

2. PWM instruction format and parameter description.

Instruction format:

Parameter description:

Operand type	Content	Data type	Word software component	Range
S1.	Word soft component numbers of Pulse width (ms) data or saving data	BIN 16 bit	KnX, KnY, KnM, KnS, T, C, D, R, V, Z, K, H	0~32767ms
S2.	Word soft component numbers of Period (ms) data or saving data	BIN 16 bit	KnX, KnY, KnM, KnS, T, C, D, R, V, Z, K, H	1~32767ms
D.	Soft component (Y) numbers of Output pulse	BIN 16 bit	Y0-Y3	Y0-Y3

3. Function and action description

16-bit operation (PWM): Pulse output in units of period [S2.ms], Its ON pulse width is [S1.ms].

Notes:

Value of the pulse width S1. and the period S2. should be set: $S1. \leq S2.$

When instruction input is OFF, Output from D. is also OFF.

Do not operate the setting switch of the pulse output mode during pulse emission.

4. Program Example

In this example, the data range of D10 is changed from 0 to 50, and the average output of Y0 is 0 to 100%. If D10 data >50, it will be wrong.

Example for smooth loop

$R \gg P$

$t = R(K\Omega) * C(\mu F) = 470ms \gg T0$

Compared to the pulse period $T0$, the time constant τ of the filter is a very large value.

The fluctuation value Δe of average output current e is approximately $\frac{\Delta e}{e} \approx \frac{T0}{\tau}$

5. Special Note

Conventional PWM

- 1) Support a total of 4 channels Y0-Y3 (please select transistor MT output);
- 2) There is no limit to the pulse width and pulse period, both in milliseconds (ms).

8. Coolmay MX3G PLC Communication Instructions

MX3G PLC has default RS232 programming port, and two communication ports (Rs232 or Rs485) can be added. Meanwhile, CANbus is also optional.

8.1 MODBUS instruction interpretation and communication

address

PLC, when as master, support ADPRW command, RD3A command, WR3A command, this section will give you detailed description about these commands.

8.1.1 RD3A/WR3A command function and action description:

For CoolMay PLC, the RD3A instruction corresponds to Modbus's No. 03 function.

In the instruction,

m1 represents the station number of the read slave device, range: 1-247;

m2 represents the first address number of the read data in the slave device;

D represents the number of registers read, range: 1-125 (When Modbus ASCII, range is 1-45; When CAN communication, range is 1-90), and the read data is sequentially stored in the host D.+1, D.+2.

D-1 address value must be set to (=0: serial port 2; =1: serial port 3)

Write data to the slave (WR3A):

For CoolMay PLC, the WR3A instruction corresponds to Modbus's 06 and 10 functions.

In the instruction,

m1 represents the station number of the slave device to be written, range :1-247.

m2 represents the first address number of the write register in the slave

device;

S represents the numbers of registers to be written, ranging:1-123(When Modbus ASCII,range is1-45; When CAN communication,range is 1-90). The data to be written is sequentially stored in the host S.+1, S.+2.

S=1, the WR3A instruction corresponds to the Modbus 06 function.

S=2-123, the WR3A instruction corresponds to the Modbus 10 function.

S.-1 address value must be set to (=0: serial port 2; =1: serial port 3)

RD3A and WR3A only support the below MODBUS functions:

Function No. 03: Read holding register and takes the current binary value range of 1-125 in one or more holding registers.

Function No. 06: Load the specific binary value into a holding register (write register) ,range:1.

Function No. 16: Preset multiple registers, load specific binary values into a series of consecutive holding registers (write multiple registers),range:1-123.

8.1.2 ADPRW command function and action description

ADPRW instruction supports all functions of the MODBUS RTU.

No. 01: Read coil status and get the current status (ON/OFF) of a group of logic coils, range 1-512

No. 02: Read the input status and get the current status (ON/OFF) of a group of switch inputs, range 1-512

No. 03: Read the retentive register and get the current binary value in one or more retentive registers, ranging from 1-125

No. 04: Get the current binary value in one or more input registers, range 1-125

No. 05: Force a single coil to force the on/off state (write bit) of a logic coil, range 1

No. 06: Load specific binary values into a retentive register (write register), range 1

No. 0F: Force multiple coils, forcibly open and close a series of continuous logic coils (write multiple bits), range 1-1968

No. 10: Preset multiple registers, load specific binary values into a series of consecutive holding registers (write multiple registers). Range 1-125

S. indicates the station number of the slave device to be read and written, the range is 0-247;

S1. indicates the function code (that is, the functions NO 01-06, 15, and 16);

S2. The function parameter corresponding to each function code (the operand indicates the MODBUS start address when the function is 01);

S3. The function parameters corresponding to each function code (the operand indicates the number of access points when the function is 01, and the parameter is fixed to 0 when the 05 function is used);

D. indicates the starting position of the data storage device.

8.2 Serial port 1: RS232(PLC programming port)

Support Mitsubishi programming port protocol; Can be used to download PLC program or communicate with devices which support MITSUBISHI programming port protocol.

8.3 Serial port2:RS485(A B)/RS232

Support Mitsubishi programming port protocol, RS protocol and MODBUS RTU protocol;

The special relays and registers related to this serial port are as below

Functions	Serial port 2(A/B)	Serial port 3(A1/B1)	Remark
Mitsubishi programming port protocol	M8196=0	M8192=0	Power lost can not be retentive

M8196: the activation flag of using programming port protocol and other protocol .

M8125: the activation flag of using MODBUS and the original Mitsubishi function.

M8122: RS sending flag (this bit needs to be set 1 when using the RS instruction, and it will automatically reset after sending).

M8123: RS receiving completion flag (need to reset manually).

M8124: RS command data is being received.

M8161: 8-bit/16-bit mode flag of RS instruction .

M8128: RD3A / WR3A receive the correct flag.

M8129:RD3A/WR3A communication over-time flag. (when communication is over-time, flag is ON)

M8029: Communication completion flag (communication completion flag when using ADPRW instruction, needs to be reset by hand).

D8120: The detailed communication parameter settings of saving Modbus RTU protocol are seen as below.

D8121: Save the host or slave station number. (It must be set as max. K255 as master)

D8129: RD3A and WR3A timeout period. (The unit is milliseconds, it is recommended to set: when the communication rate setting is greater than or equal to 9600, D8129 is set to 10~20; when the communication rate setting is less than 9600, D8129 is set to 20~50;)

D8126: The number of interval cycles. Default=10 (times).

D8397: When using the serial port 2 for ADPRW instruction, D8397 needs to be set to 0.

Support RS, WR3A, RD3A, ADPRW instructions. Can be set in the parameter zone, corresponding to serial port 2. The parameter zone settings are only valid for this channel. It is invalid for serial port 3.

8.3.1 Mitsubishi programming port

When used as Mitsubishi programming port protocol: set M8196=0.

8.3.2 Mitsubishi BD Agreement

When used as the Mitsubishi BD protocol function: set M8196=1, M8125=0; D8120 is set as the communication parameter, and D8121 is set as the slave station number. For example, set D8120=H6086, D8121=H1 (communication parameter is 9600/7/E/1, slave station number is 1).

8.3.3 Freeport protocol function and example

When used as a Mitsubishi Freeport protocol function: set M8196=1, M8125=0. The difference between Mitsubishi protocol 1 and protocol 4 is that there are terminator 0A 0D (stored in D8124 and D8125 respectively).

For Mitsubishi Freeport protocol, RS instruction is supported, D8120 only needs to set the value of the lower 8 bits.

RD3A Program example (refer to [8.1.1](#)):

Slave program:

Master program:

Program explanation:

D300 saves the number of registers read, here it means reading 10 data.

When using serial port 2, D299 at D.-1 must be set to 0.

This program represents that 10 data of the registers D100-D109 in the PLC with the slave station 1 are read and stored in the registers D301-D310 of the master station PLC.

WR3A Program example (refer to [8.1.1](#)):

Master program:

Slave program:

Program explanation:

This program represents that 1 data of the register D301 in the master PLC is written to the PLC in Slave 1, and is stored in the register D100 of the slave PLC.

8.3.5 MODBUS RTU ADPRW command

03 function code hold register output. (refer to [8.1.2](#)):

8.3.6 Modbus ASCII Protocol

When used as **Modbus ASCII** protocol, specific parameter setting pls refer to [8.3.3](#), Only the 12th bit of D8120 is set differently, checking D8120 parameter setting in section 8.3.3.

Note: In **modbus ASCII** protocol, **ADPRW command** is not supported.

Program example:

8.4 Serial port 3:RS485(A1 B1)

Support Mitsubishi programming port protocol,RS2 protocol and MODBUS RTU protocol.

The special relays and registers related to this serial port are as below.

Functions	Serial port 2(A/B)	Serial port 3(A1/B1)	Remark
Mitsubishi programming port	M8196=0	M8192=0	Power lost can not be retentive

M8192: the activation mark of using programming port protocol and other protocol. (power lost not retentive).

M8402: Send mark (use when RS2 command).

M8403: Communication completion mark (communication completion flag when using RS command, needs manual reset).

M8404: Data is receiving.

M8408: Communication completion mark (Valid while using ADPRW command).

M8409: Communication time out.

M8029: Communication completion mark (communication completion mark while using ADPRW instruction and needs manual reset).

M8161: 8-bit/16-bit mode distinguishing mark for RS/RS2 command.

D8400: Save the communication parameters of the Modbus RTU protocol.

D8401: Save the communication mode of serial port 3.

D8401=H0 represents the RS free communication mode.

When Modbus RTU: D8401=H11 represents PLC as Slave. D8401=H1 represents PLC as Master.

When Modbus ASCII: D8401=H11 represents PLC as Slave; D8401=H10 represents PLC as Master.

D8406: Interval period. Default as 12 times.

D8409: overtime time. (The unit is milliseconds, it is recommended to set: when the communication rate is greater than or equal to 9600, D8409 is set to 10~20; when the communication rate is set to less than 9600, D8409 is set to 20~50;)

D8414: Save the master or slave station number (The value must be set as max K255 as master).

D8397: When using the ADPRW instruction, use serial port 3, and D8397 must be set to 1.

Support RS2,WR3A,RD3A,ADPRW commands. Can be set in parameter zone, correspond to serial port 3. Parameter zone settings are valid only for this channel. Invalid for serial port 2.

1. N:N network setting device

Soft element	name	content	Set value
M8038	Parameter setting	Set the flag for communication parameters. It can also be used as a flag to confirm the presence of N:N network programs. Do not turn ON in the sequence program.	
D8176	Corresponding station number setting	N:N network setting station number when using. The master station is set to 0, and the slave station is set to 1 to 15. [Initial value: 0]	0~15
D8177	Slave total number setting	Set the total number of slave stations. No setting is required in the PLC of the slave station. [Initial value: 7]	1~15
D8178	Refresh Range setting	Select the mode of the number of device points to communicate with each other. No setting is required in the PLC of the slave station. [Initial value: 0]	0~2

D8394	Serial channel selection	=2: Serial port 2 =3: Serial port 3	2~4
-------	--------------------------	--	-----

2. Components for judging N:N network errors

M8184~M8190, M8496~M8503: The data transmission sequence error flag of the slave station.

When a data transmission sequence error occurs in each slave station, the corresponding flag bit turns ON.

3. Link device

It is a device for sending and receiving information between programmable controllers. The device number and the number of points used differ depending on the station number set in the corresponding station number setting and the mode set in the refresh range setting.

1) Mode 0 (D8178=0):

8.5.2 Program setting and description

The program settings are as shown below. It is recommended to set the timeout wait register D8129/D8409/D8429 above 12. It is only necessary to set the corresponding special register to achieve the data sharing of the corresponding interval register and auxiliary relay. Channel M8184~M8190 and the rear 8 channels M8496~M8503, you can check the status of each slave, if there is no connection, turn ON

1. Serial port 2

Master program:

Slave program:

2. Serial port 3

Such as serial port 2, only need the master and slave program to set D8394=3
